Revision History

The Revision History table below provides a record of all revisions made to this document throughout its life cycle. Updates are tracked by the date the revisions were made, the version number, a brief description of the changes made and the reason, as well as the name of the reviser and the approver.

Effective Date	Version #	Change Reason	Description /	Created/Revised by
08/07/2024	2.0	Sightview Revision		Lora Woltz

Introduction

The purpose of this document is to list the API endpoints and methods provided by iMedicWare to interact with iDoc applications, giving third-party developers a valid channel to pull data from iDoc applications. This document will guide you through the authentication mechanism and the various API methods and endpoints available for data sharing through the iDocAPI.

Request parameters can be sent either as POST parameters or in the request payload in JSON format.

Terms of Use

This document is provided “as-is,” without warranty of any kind. iMedicWare expressly disclaims all warranties, whether express or statutory, regarding this document, including without limitation any warranty of fitness for a particular purpose, title, security, accuracy, and non-infringement. Without limiting the foregoing, iMedicWare makes no warranty or representation that access to or operation of this service will be uninterrupted or error free. You assume full responsibility and risk of loss resulting from your downloading and/or use of the files, information, content, or other material obtained from iMedicWare’s website.

REST API Documentation

1. Authentication

This is the step to authenticate the calling party on the iDoc end. At this step, we validate the calling user's credentials and provide an authentication token to the user, marked with a certain expiry time. Generally this call needs to be triggered once a day. The user can cache the token generated on its end and use it for further API calls for the day. Any iDoc user with the API Access privilege is allowed to interact with the iDoc API endpoints.

Process

- Before sending any API call, the user must obtain an access token to authenticate the API call.
- If the credentials passed in the API call are matched against the user record in the iDoc database, an authorization token will be generated. It will be logged in the iDoc database along with the IP address of the client computer sending the request for token generation.
- The authorization token will have a lifetime of 24 hours.
- All future requests will require the authorization token for authentication.

Endpoint:

{iDocURL}/IMWAPI/getToken

Request Data:

Sr.No.	Field Name	Data Type	Comments
1.	userId*	String	iDoc user id
2.	password*	String	iDoc password

Sample JSON:

```
{
  "userId": "admin", "password":
    "xxxxxxxxxxxxxx"
}
```

11. Care Team Members

This call will provide data for the CCDS category Care Team Members.

Endpoint:

{iDocURL}/IMWAPI/getCareTeamMembers

Request Data:

Sr.No.	Field Name	Data Type	Comments
1.	patientId*	Integer	Patient MRN in iMW
2.	startDate	Date	Format: YYYY-MM-DD
3.	endDate	Date	Format: YYYY-MM-DD
4.	accessToken*	String	

Start date is based on the date of service (DOS) of the patient. This must be the value from the response of the getVisitDOS API call. If the start DOS is not given, this will pull data from the last DOS for the patient.

Sample JSON:

```
{
  "accessToken": "3acd14c87d7c537d6568efd62235577b0558363c716d09b6f79e90d15be480d6",

This call will provide data for the CCDS category Clinical Notes.

Endpoint:

{iDocURL}/IMWAPI/getClinicalData/pathologyReportNarrative

Request Data:

Sr.No.	Field Name	Data Type	Comments
1.	patientId*	Integer	Patient MRN in iMW
2.	startDate	Date	Format: YYYY-MM-DD
3.	endDate	Date	Format: YYYY-MM-DD
4.	accessToken*	String	

Date range filter will work only when both the start date and end date are given. If only the start date is provided, the API will pull data for that date only.

Method:

POST

Response Data:

```

REST API Documentation

27. Errors and Exceptions

This section describes the errors and exceptions that may occur while interacting with the myCare iMedicWare API.

The iMedicWare API is built on the principles of REST (Representational State Transfer) architecture. Error messages in the API are self-explanatory. The error message conveys the details regarding the error in a textual format, along with a suitable HTTP status code.

List of HTTP status codes:

- 200 – successful operation
- 400 – parameter errors
- 401 – access errors
- 404 – API endpoint errors
- 422 – request content errors
- 500 – internal server errors
- 503 – service errors on server
